Key User Workflow

Four screens, and the alternative routes users take through them

1 Home

ENTRY POINT

- User enters the application and lands on the home page
- From here they choose their route: portfolio viewer, build or edit a scenario, or review past results

2 Portfolio Viewer

REVIEW AND SHORTLIST

- KPI cards and charts on portfolio shape and quality frame the decision
- Selecting a data point on any chart or table auto-assigns a green tick
- Ticked records build a shortlist in the entity listing table across the bottom third

3 Build a Scenario

CONFIGURE AND SAVE

- Shortlisted entities carry region and country metadata for provenance
- Switch an entity off to exclude it from the scenario being built
- Adjust equity share, chance of success or shift the schedule
- Apply per entity, then save the scenario to the browser cache

4 Scenario Results

REVIEW THE OUTCOME

- Opens a layout that mirrors the portfolio analysis screen
- KPI cards first, then plots, then a summary of the changes made

ITERATIVE
Shortlist, configure, then return to the viewer and repeat until the scenario is ready to save.

ALTERNATIVE ROUTES · WHERE THE USER CAN ENTER AND HOW THEY MOVE

FULL JOURNEY
review the portfolio, shortlist, build, then read the results

BUILD FIRST
straight to the scenario builder to create a new scenario or edit an existing one

RESULTS ONLY
jump to the results of a previous scenario run

PROPOSED DESIGN · SECTION 01 OF 04

Home

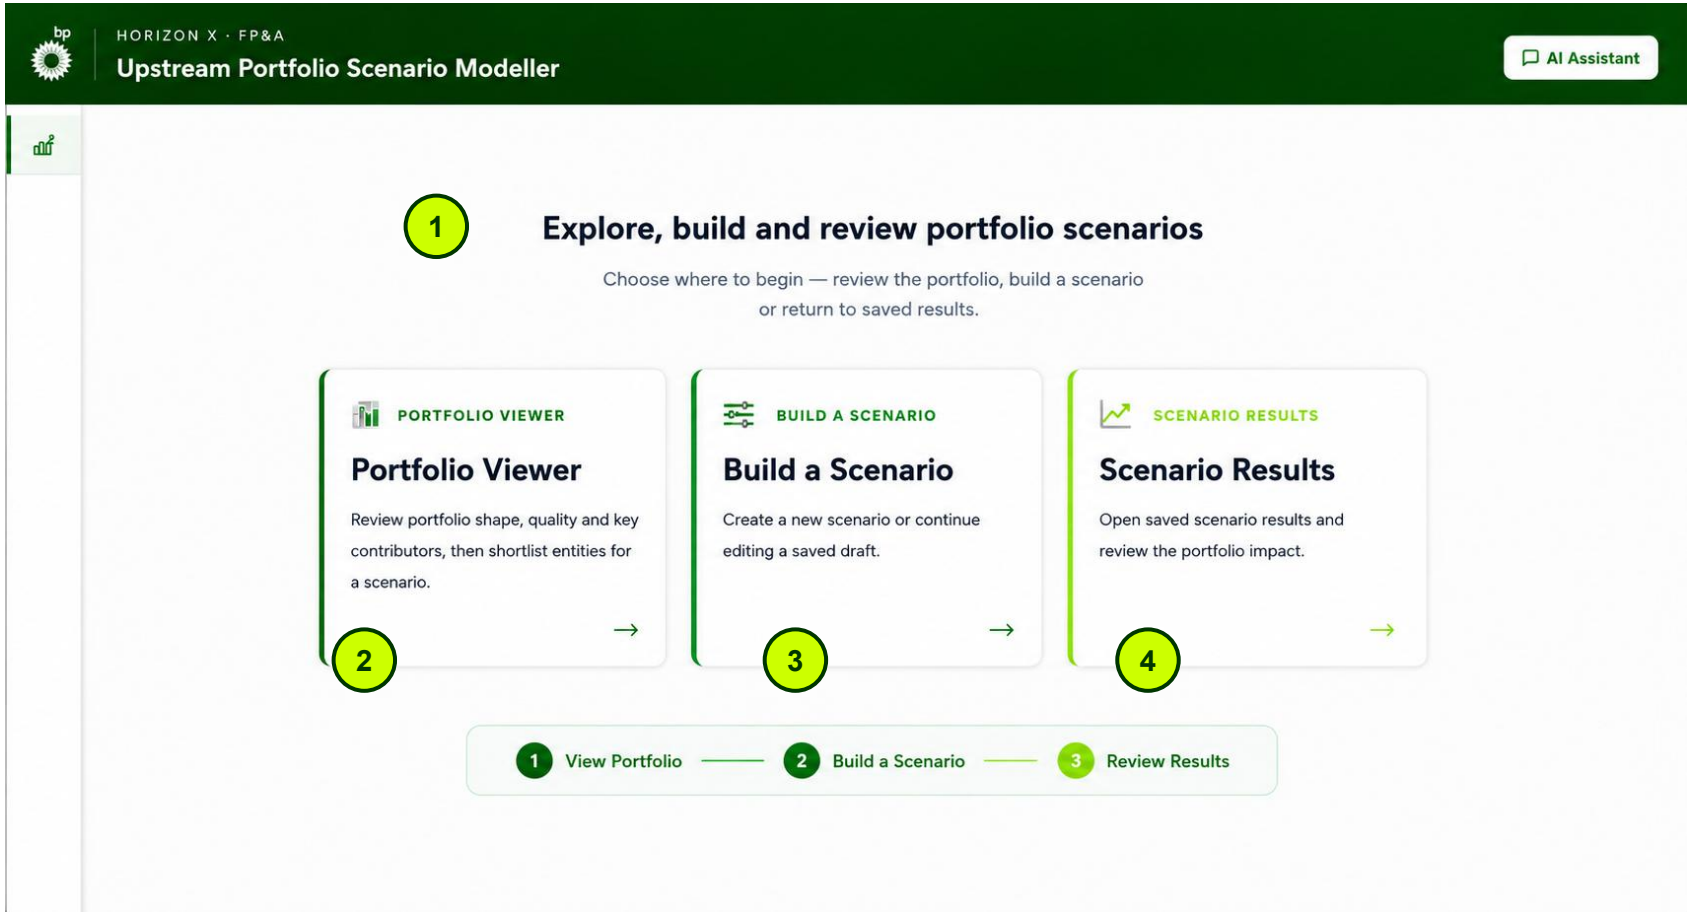

Entry Point

Start the journey and choose the appropriate route

Home Page simplified navigation

PROPOSED DESIGN

CHANGE NOTES

1 Simplified navigation

- Four-tile menu reduced to three active destinations aligned to the core user journey
- Disabled and overlapping navigation routes removed

2 Portfolio review and shortlisting

- Portfolio Viewer is a dedicated starting point for understanding portfolio shape, quality and key contributors
- Selected entities carry directly into scenario construction

3 Single scenario-building route

- New and Edit Scenario combined into one Build a Scenario destination
- Start a new scenario or resume a saved draft within the same workspace

4 Clear end-to-end journey

- Scenario Results gives direct access to previously saved outcomes
- Journey indicator makes the intended flow explicit: View Portfolio → Build a Scenario → Review Results

PROPOSED DESIGN · SECTION 02 OF 04

Portfolio Viewer

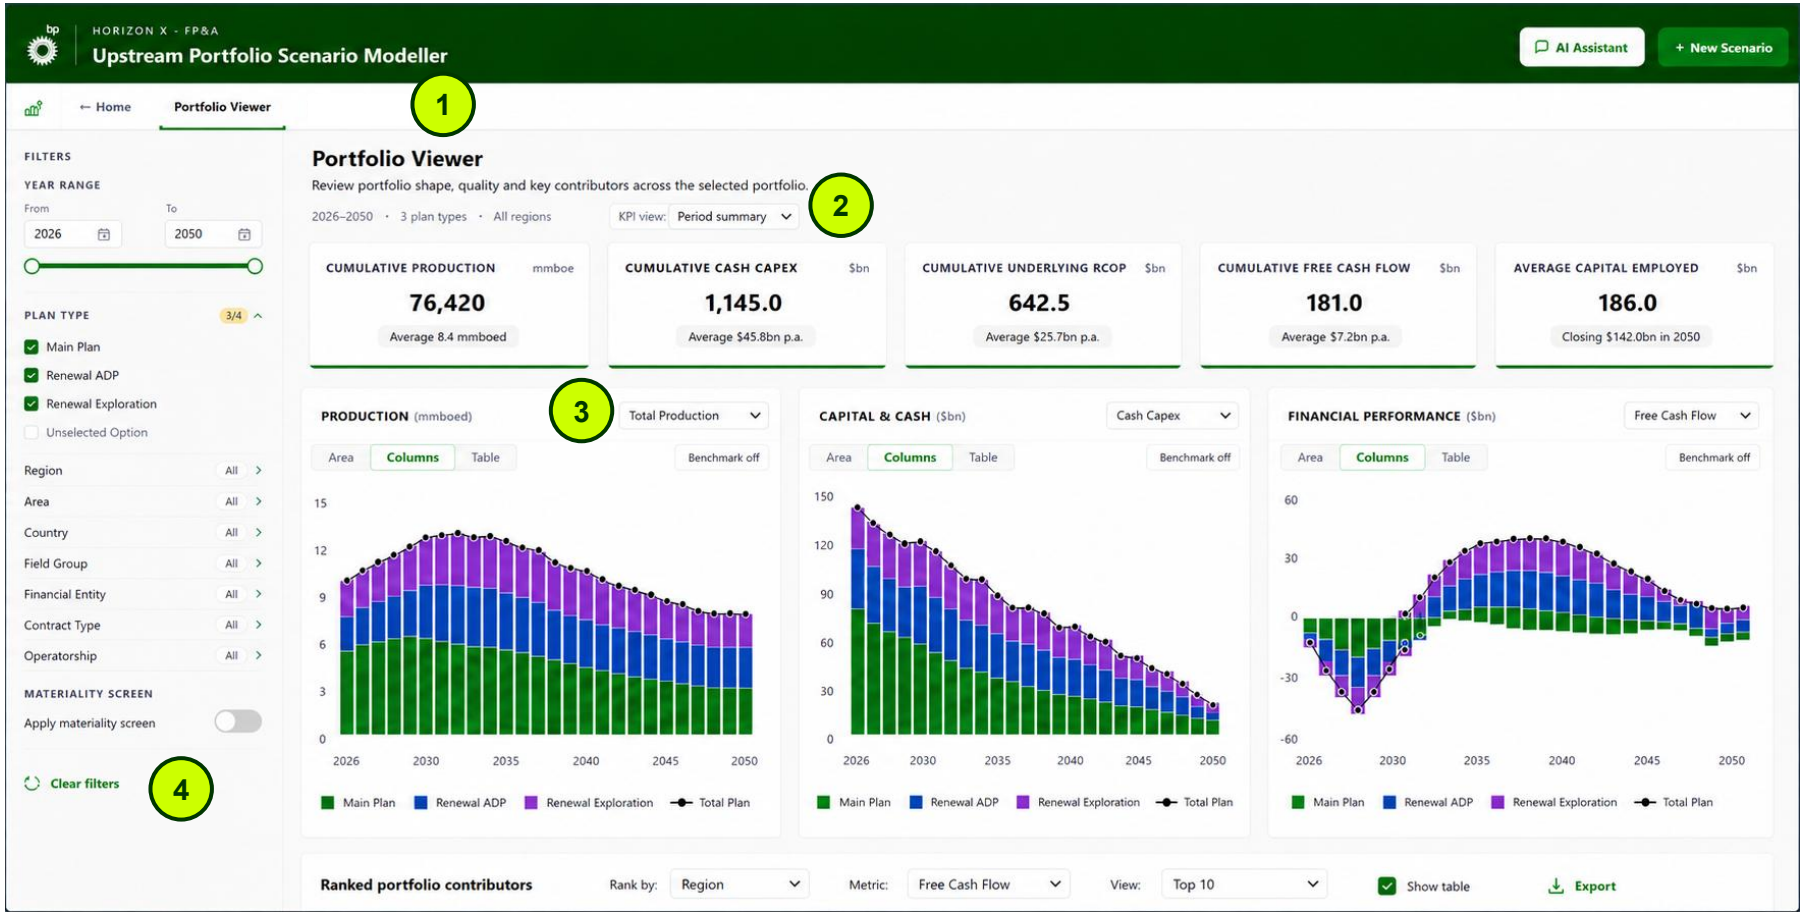

Review and Shortlist

Analyse portfolio shape and quality, then shortlist entities

Portfolio Viewer screen height 1 of 3

PROPOSED DESIGN

CHANGE NOTES

1 Clear page context

- Page renamed Portfolio Viewer, with helper text explaining its role
- Context summary shows the selected period, Plan Types and geography

2 Decision-focused KPI summary

- Selectable KPI view presents selected-period portfolio measures first
- Callouts show annual averages or closing values, with units stated

3 Flexible portfolio visuals

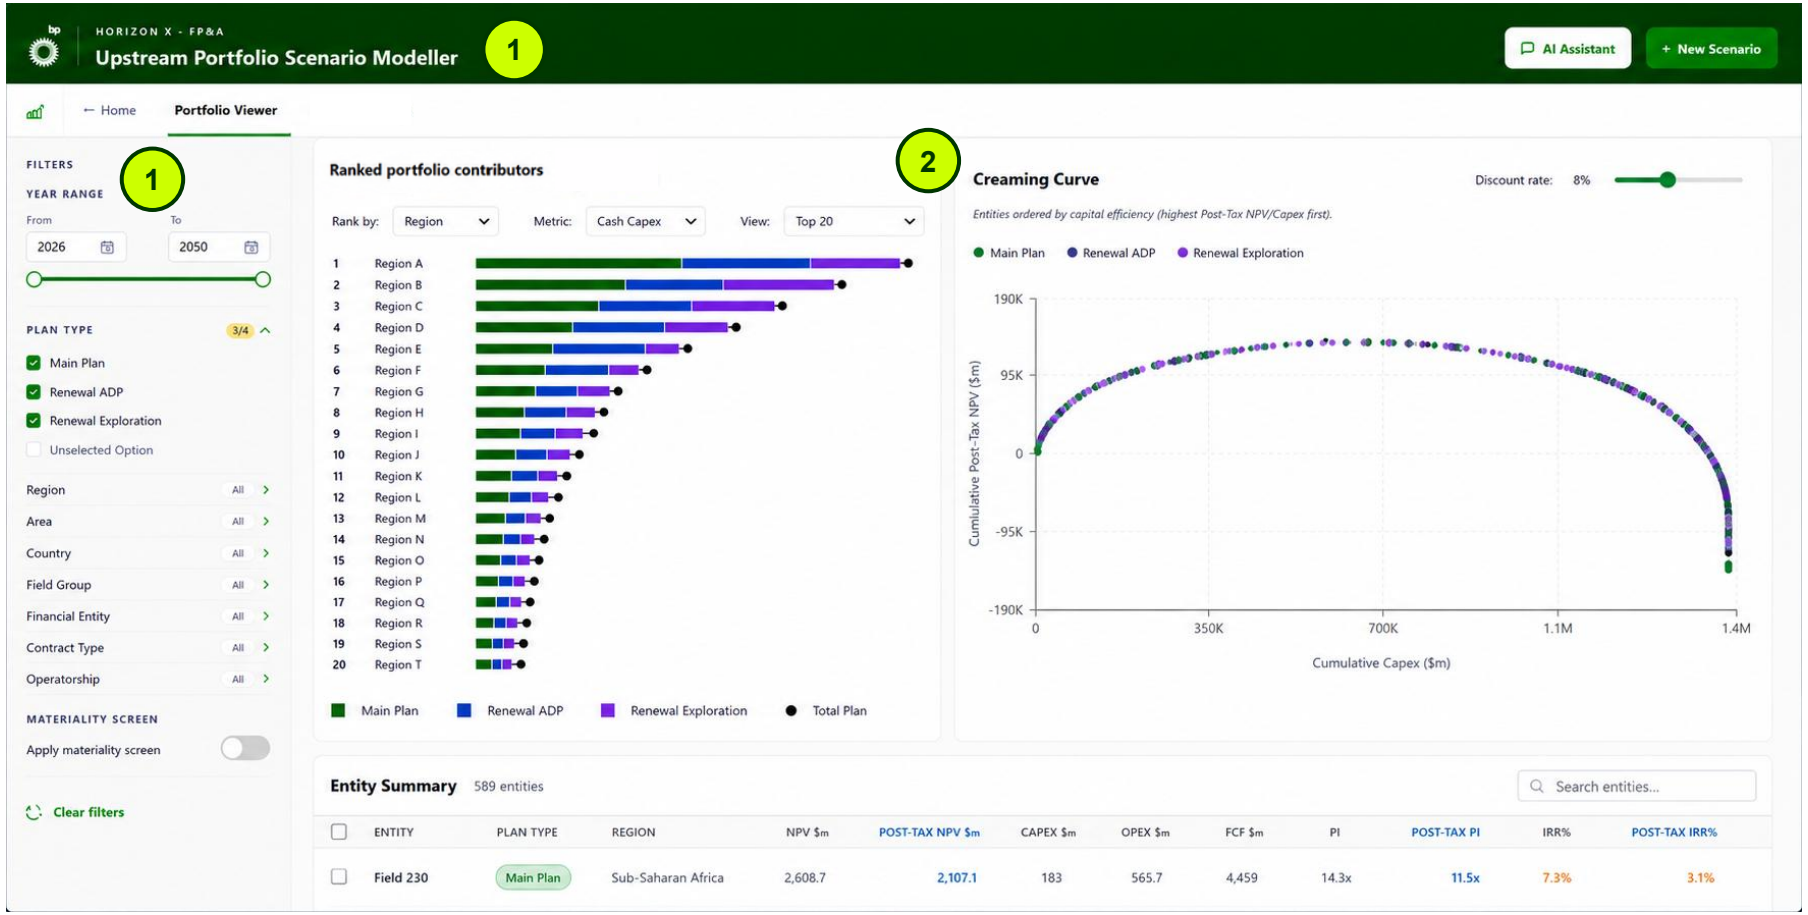

- Consistent chart cards and metric selectors across the three panels
- Area / Columns / Table controls choose the presentation
- Stacked values show Plan Type composition, with a Total Plan line
- Benchmark controls stay hidden until activated

4 Expanded filter rail

- Adds Area, Field Group, Financial Entity, Contract Type and Operatorship filters
- Materiality settings stay collapsed until enabled
- Fixed rail keeps analytical context visible as content scrolls

Portfolio Viewer screen height 2 of 3 · on vertical scroll

PROPOSED DESIGN

CHANGE NOTES

1 Persistent analytical context

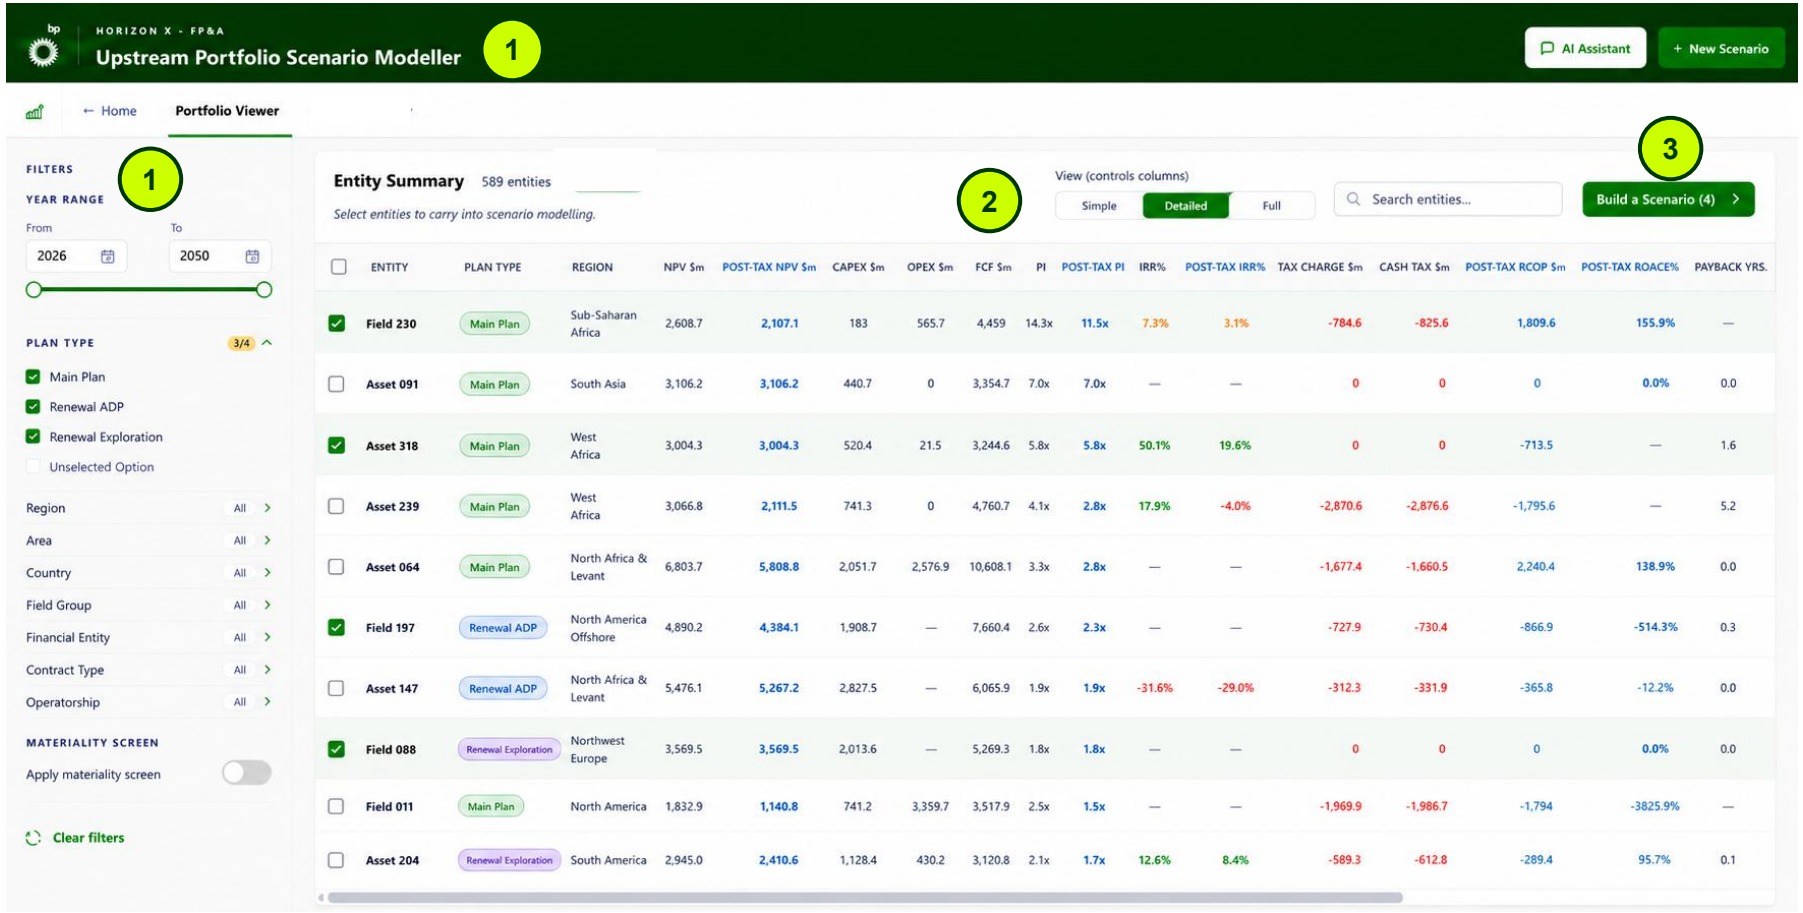

- Header, navigation and filter rail stay fixed while the content scrolls
- Selected period, Plan Types and filters remain visible throughout the analysis

2 Prioritisation and linked selection

- Ranked Portfolio Contributors and the Creaming Curve give complementary views of scale and capital efficiency
- Ranking dimension, metric and Top / Bottom view are selectable, with an adjustable discount rate on the curve
- Both visuals respond to the same filters for a consistent basis
- Selecting a bar or curve point highlights the entity in the Entity Summary below, supporting shortlisting

Portfolio Viewer screen height 3 of 3 · on vertical scroll

PROPOSED DESIGN

CHANGE NOTES

1 Persistent application context

- Header, navigation and filter rail remain fixed in the final scroll section
- Selected portfolio scope stays visible while entity-level detail is reviewed

2 Unified entity review and selection

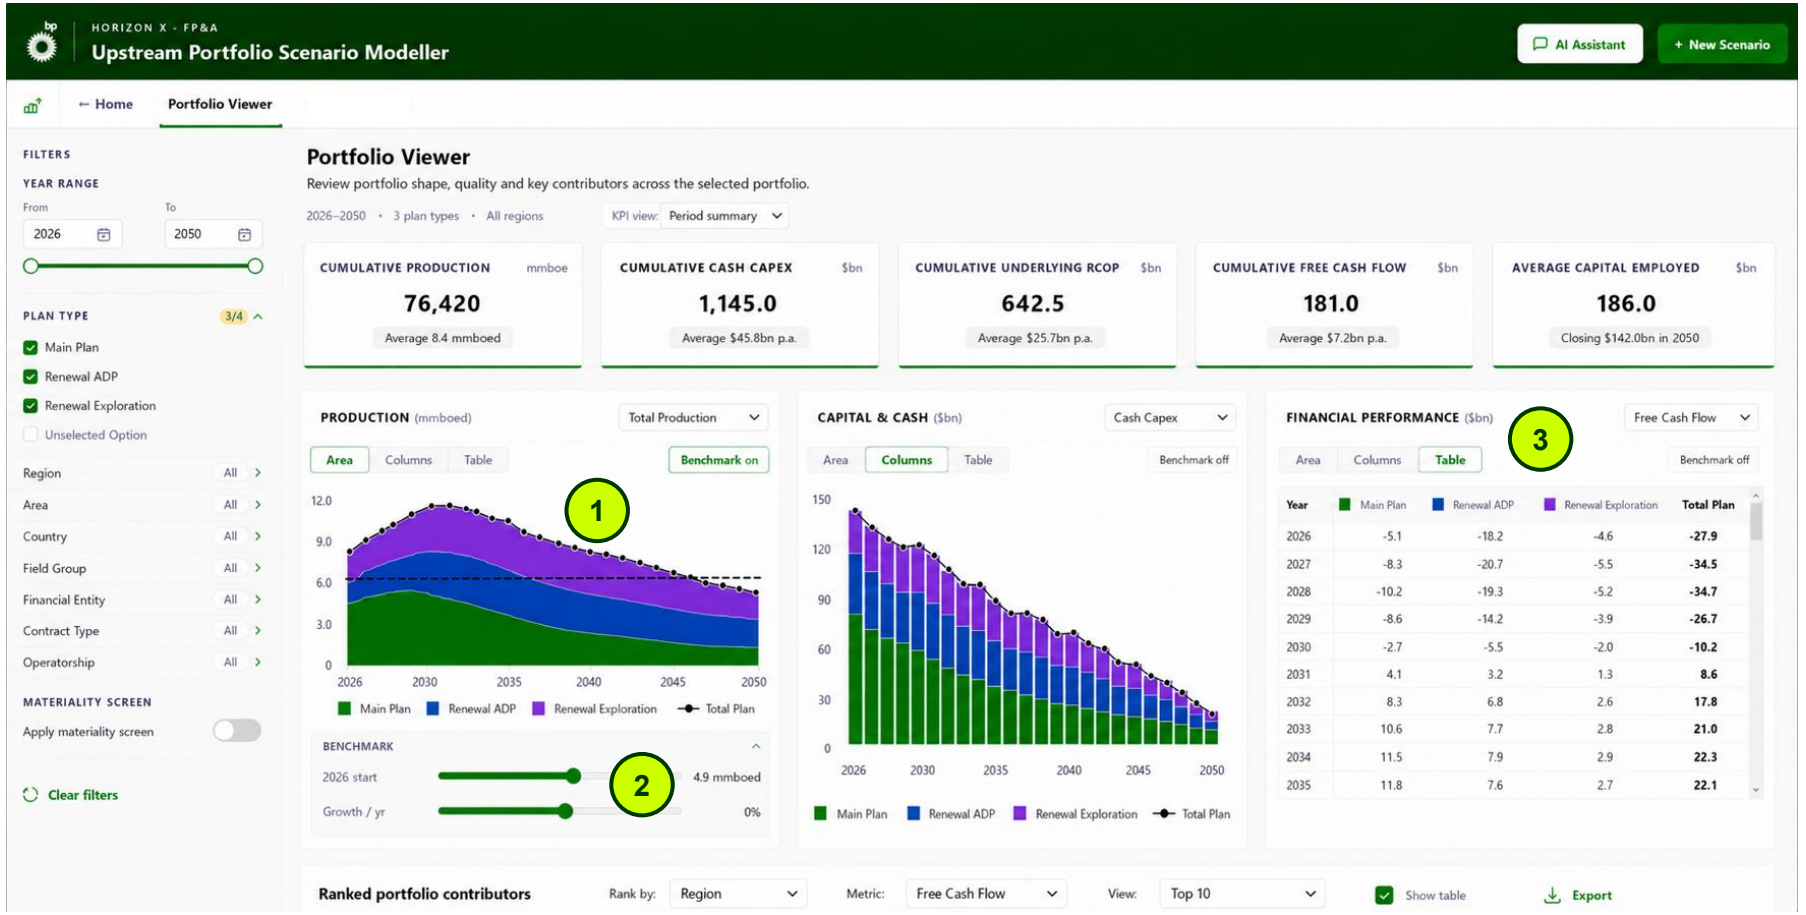

- Entity Summary incorporated into Portfolio Viewer, removing the separate Portfolio Quality page
- Selectable rows and green selection states make the current shortlist immediately visible
- Simple / Detailed / Full views control column density; exact fields can be agreed in development

3 Controlled hand-off to scenario building

- Build a Scenario shows the live count of selected entities and carries the shortlist forward
- Creates a deliberate transition from review and selection into scenario configuration

Portfolio Viewer alternative visual types · benchmarking enabled

PROPOSED DESIGN

CHANGE NOTES

1 Independent visual views

- Each panel switches independently between Area, Columns and Table views
- Here Area is used for Production and Columns for Capital & Cash, so the presentation suits each measure

2 Progressive benchmark controls

- Enabling Benchmark adds an adjustable guide line to the selected chart
- Starting value and annual growth controls appear only when benchmarking is active

3 Exact-value table view

- Financial Performance switched from chart to table, showing annual values by Plan Type and Total Plan
- Exact figures can be inspected without leaving the page or losing filter context

Summary of changes all three screen heights

PROPOSED DESIGN

SUMMARY OF CHANGES

1 Clear page purpose

- Portfolio Viewer naming, helper text and context summary establish the page's purpose and selected scope
- Header and navigation remain fixed as the content scrolls

2 Decision-focused KPI summary

- Selected-period KPI cards surface portfolio totals first, supported by annual averages or closing values and consistent units

3 Flexible visual analysis

- Consistent Production, Capital & Cash and Financial Performance panels provide metric selectors and Area / Columns / Table views
- Stacked Plan Types retain the Total Plan view, with benchmark controls available when required

4 Expanded filter rail

- Adds Area, Field Group, Financial Entity, Contract Type and Operatorship filters
- Materiality controls remain collapsed until enabled, while the filter rail stays fixed during scrolling

5 Portfolio prioritisation

- Ranked Contributors and the Creaming Curve compare portfolio scale and capital efficiency using a shared filter context
- Linked selections carry chosen entities into the Entity Summary

6 Unified entity review and selection

- Entity Summary is incorporated from Portfolio Quality, creating one continuous review and shortlisting workflow
- Simple / Detailed / Full views allow users to control the level of displayed detail

7 Controlled scenario hand-off

- Build a Scenario displays the live selected-entity count and transfers the shortlist into scenario configuration

PROPOSED DESIGN · SECTION 03 OF 04

Build a Scenario

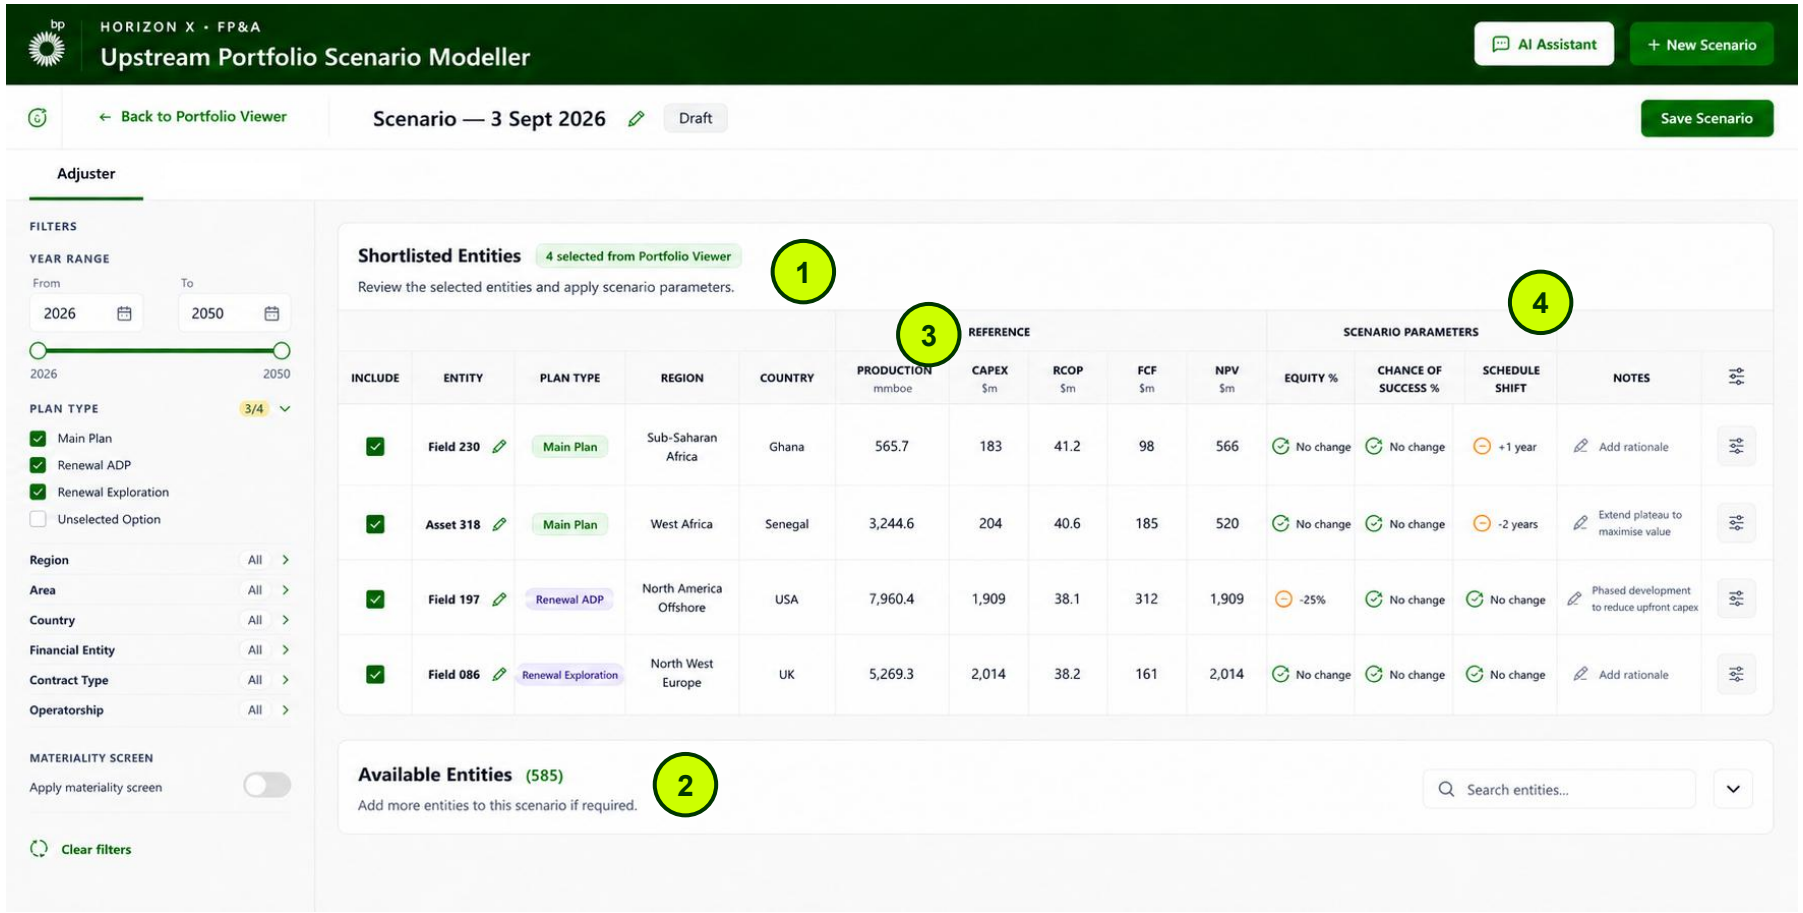

Configure and Save

Adjust the shortlisted entities and save the scenario

Build a scenario with configuration pane **closed**

PROPOSED DESIGN

CHANGE NOTES

1 Shortlisted entity workspace

- Entities selected in Portfolio Viewer carry directly into the scenario workspace, preserving traceability
- Table separates entity details, reference measures and scenario parameters for faster comparison

2 Available entities retained

- Non-shortlisted entities stay accessible in a separate, searchable Available Entities section
- Collapsed by default to maintain focus, while still allowing further entities to be added

3 Reference context for decisions

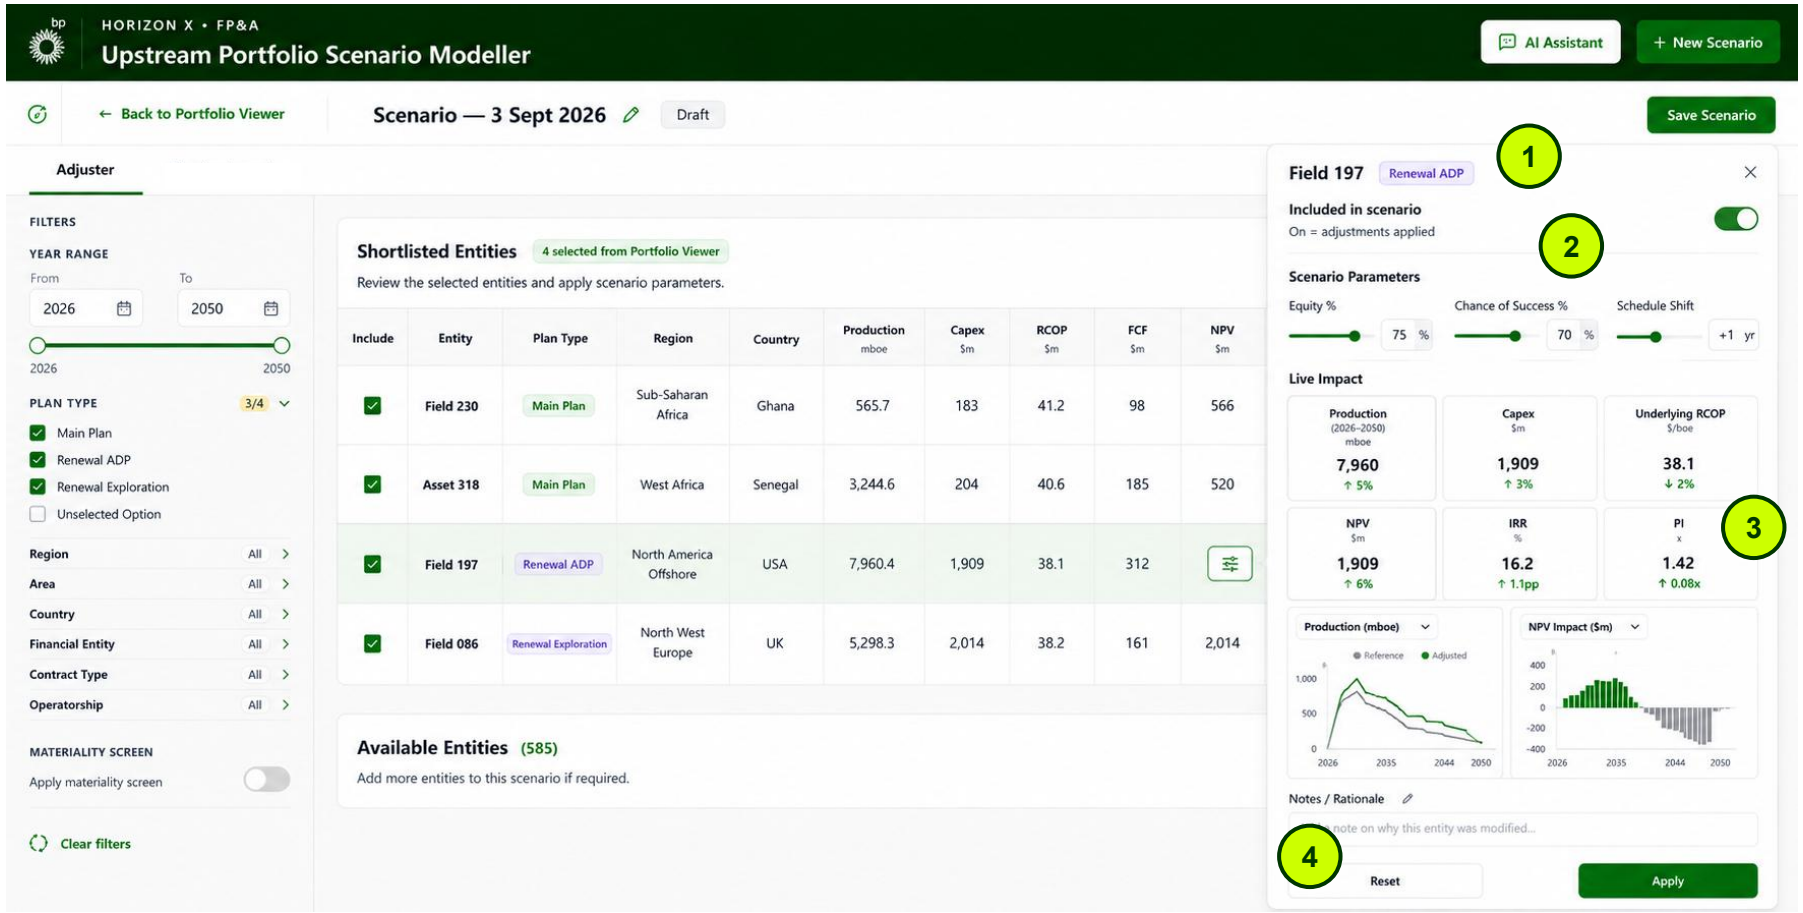

- Read-only Production, Capex, RCOP, FCF and NPV measures show each entity's scale and value before adjustment
- Gives the context needed to make informed scenario changes

4 Controlled scenario configuration

- Include status, Equity, Chance of Success, Schedule Shift and rationale stay visible at row level
- Configuration control opens a contextual adjustment pane, keeping detailed changes out of the table

Build a scenario with configuration pane **open**

PROPOSED DESIGN

CHANGE NOTES

1 Contextual adjustment pane

- Opens from the selected entity row and overlays the parameter area without resizing the table
- Active row stays highlighted, with Entity and Plan Type visible to preserve context

2 Controlled parameter inputs

- Inclusion toggle makes clear whether the entity's adjustments will be applied
- Equity, Chance of Success and Schedule Shift change independently, with current values shown

3 Immediate impact preview

- KPI cards quantify the effect on Production, Capex, RCOP, NPV, IRR and PI before changes are applied
- Configurable charts compare reference and adjusted profiles and show the annual NPV impact

4 Rationale and confirmation

- Notes capture the business rationale for each entity-level adjustment
- Reset and Apply separate testing from commitment, reducing unintended changes

PROPOSED DESIGN · SECTION 04 OF 04

Scenario Results

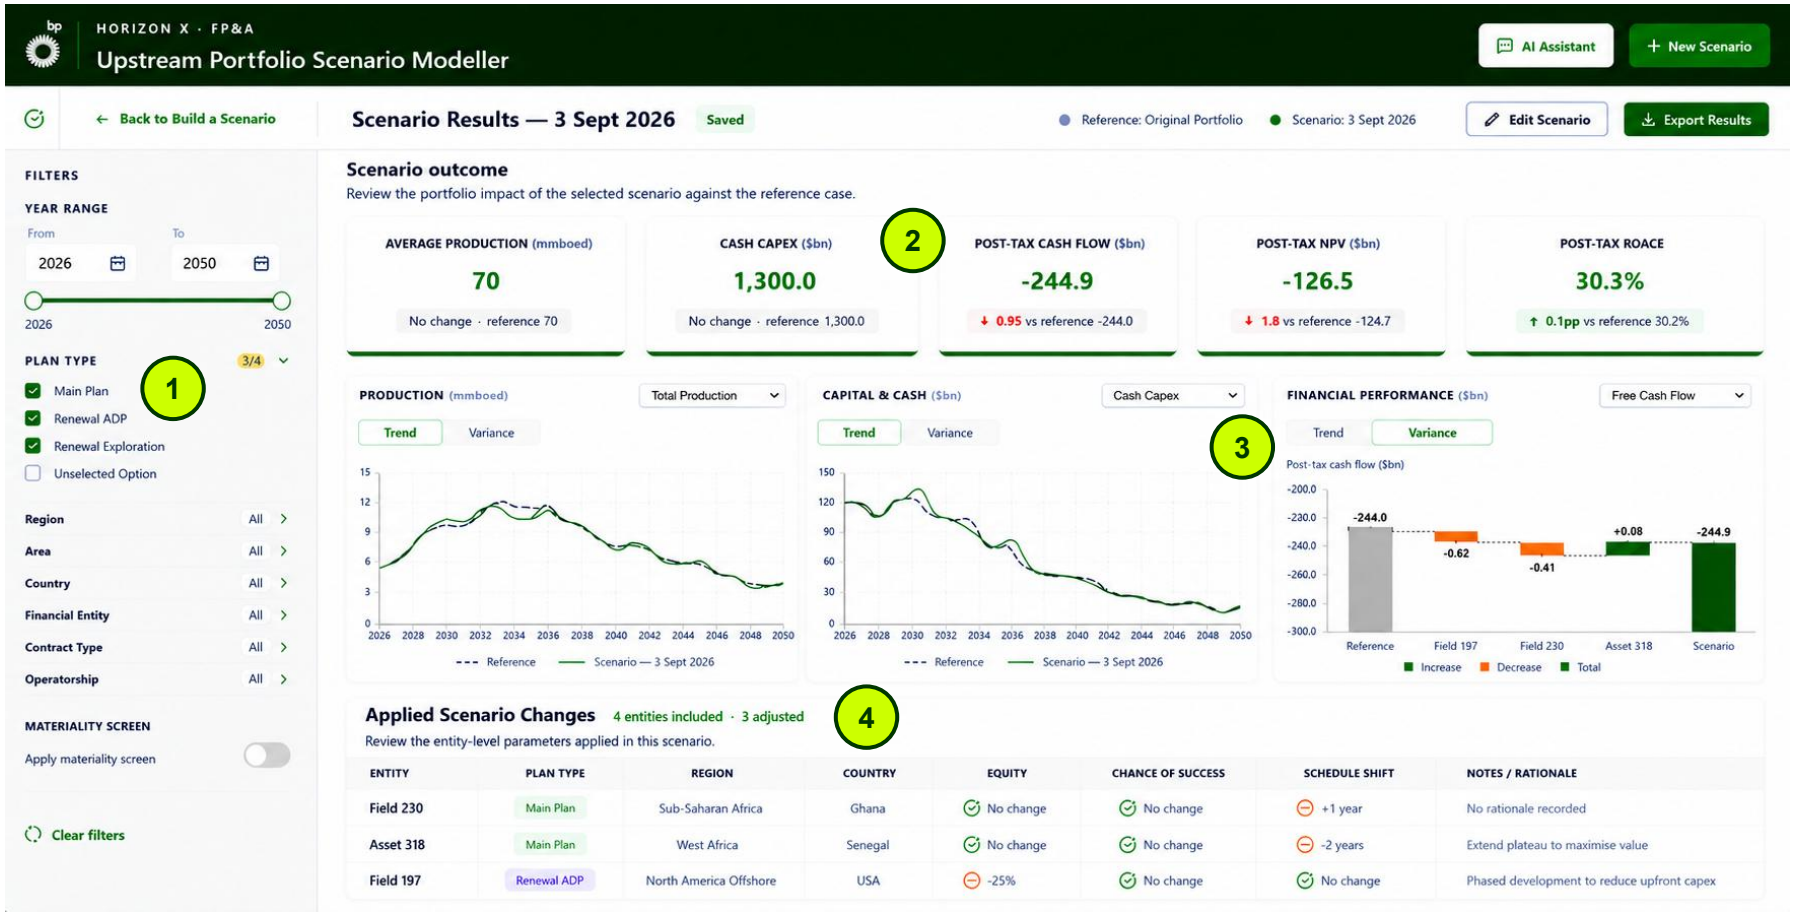

Review the Outcome

Compare the adjusted portfolio with the reference case and understand the contributing changes

Scenario Results

PROPOSED DESIGN

CHANGE NOTES

1 Consistent results workspace

- Standard filter rail and shared application layout restored
- Outputs previously spread across screens consolidated into one KPI, analysis and detail hierarchy

2 Outcome-led KPI summary

- Key outcome metrics presented in one summary row
- Each card leads with the scenario result, with reference value and variance beneath
- Financial measures use a consistent UOM basis

3 Selectable trend and variance analysis

- Each visual switches independently between Trend and Variance views
- Trend compares reference and scenario profiles over time; Variance reconciles the movement by entity

4 Traceable applied changes

- Included and adjusted entity counts distinguished, with parameters and rationale retained
- Editing stays in Build a Scenario, preserving results integrity
